Fireworks is a robust graphics tool with a large library of shapes, fonts, and colors. Fireworks supports the creation and edition of: * Line art, such as shapes, lines, and beziers * Rectangles, squares, and circles * Frames and other shapes * Text * Gradients * Layers Fireworks and Photoshop both use a layer-based system, but Fireworks supports a different type of layer. A Fireworks layer is known as a _vector_. A vector is more secure than a raster layer because it's not pixelated. Photo Projects The Photo Projects page from the Chapter 6 Cheat Sheet is a good tool to use when trying to create something that shows off your knowledge of the various features of Photoshop and Fireworks. If you're trying to create something that is highly complex, we suggest that you work on your project in a public space using a shared computer so that you are not stealing anyone else's work. This way, you don't accidentally overwrite a file or inadvertently edit someone else's photo. * * * # One-on-one ## Tanya Newman `www.tanyanewman.com` `work@tanyanewman.com` `www.flickr.com/photos/tanyanewman` Tanya Newman, a multi-award-winning photographer, was born in Italy and lives in

Pakistan has asked its former envoy to the United States to return to Islamabad, after Washington refused to extradite an alleged al-Qaeda operative, officials said on Tuesday. The move risks triggering a diplomatic rift with the United States, which accuses Pakistan of turning a blind eye to terrorism and aiding insurgents targeting American forces. Pakistan's foreign ministry has asked its former ambassador to the United States, Jalil Abbas Jilani, to return to the Pakistani capital, Islamabad, and told him he had been asked to "end all contact with all key stakeholders on bilateral and regional issues as per the instruction of the government," a ministry spokesman said in a statement. It was not clear what had prompted the request, but it follows the United States refusal to extradite Hafiz Mohammad Saeed, a co-founder of the Lashkar-e-Taiba militant group that is blamed for a number of attacks in India, from an Indian prison. Pakistani officials say Saeed, who has also been charged in U.S. federal court with financing terrorism, should be tried in Pakistan. Saeed denies the charges, saying he has never supported violence and is a religious leader with many followers. Jilani had been the Pakistan high commissioner to the United Kingdom, until he was removed in November 2013 and made ambassador to Washington. Pakistan's state-run daily, Dawn, reported that Washington had turned down the request to extradite Saeed, and some officials said it had helped make a direct appeal to President Barack Obama. The paper said Pakistan had also expressed regret over the "hasty and unwarranted" move that will trigger "serious consequences". The paper said the former ambassador would not be allowed to return to Pakistan and it was unclear whether he would be allowed to enter the United States. The United States accuses Pakistan of

providing safe haven to the militants, who carry out cross-border raids from its territory into Afghanistan. The issue is politically sensitive in Pakistan, where there are fears the government could be accused of complicity in terrorist attacks. Some leaders accuse U.S. officials of hypocritical double standards. They have recently intensified operations against the Afghan Taliban, which is allied to the Haqqani network, following the killing of two U.S. troops in an attack in which Afghan Taliban fighters ambushed and killed eight servicemen in eastern Afghanistan. U.S. forces in Afghanistan on Monday stepped up raids against Taliban leaders and training camps, killing

In the large number of industrial applications, the electronic weighing devices known by the trademarks GUTTER weigher and BAGGER weigher are used to weigh, in particular, bags filled with rice or grain, and discharged automatically by conveyor belts. The known industrial weighing devices have a series of movable components and, in particular, consist of a rigid frame equipped with fixing, support and control members and with the container or the hopper, into which the grain is poured, and which is enclosed inside the rigid frame. The rigid frame is mounted vertically onto the base of the device in such a way that it can move vertically with respect to it. The container or hopper, together with its base, is mounted rotatably with respect to the rigid frame in such a way that, when grain is poured in, the rotation determines the uniform distribution of the grains. The movable assembly is normally formed by a series of belts and pulleys with axes vertically positioned to ensure the rotational movement of the rigid frame. At the base of the container hopper

is the scale for measuring the weight of the grains poured into the container or hopper, while the reading at the top of the scale indicates the weight of the grain. The rigid frame is likewise supported and fixed onto the base of the scale and is mounted on it by means of pins and grooves. The scale is normally a linear electromagnetic scale, but an optical or capacitance scale could also be used. By means of this construction the scale is electrically connected, for example, to a fixed current loop and a microprocessor permanently linked to a computer. The weighing device is connected to the electronic circuit and the computer continuously controls the pouring of grain into the container or hopper at a rate corresponding to the weight of the grains discharged by the continuous control of the supply of current to the scale. Once the desired weight has been discharged by the electronic weigher, the weighing device is permanently disconnected from the electric current supply circuit and the computer stops operating. The electronic scales used for this purpose have different types of microprocessors with different operational speeds to measure in grams. For example, if the weight to be weighed is more than about one ton, a 32-bit microprocessor is generally used to a 256-bit microprocessor or more. However, if the weight to be weighed is much less than one ton, an 8-bit microprocessor is generally used to a 16-bit microprocessor or more.
